題目說明

題目說明

現今資訊量龐大，投資者無法一時掌握所有資訊，我們希望能夠以最簡單明瞭的方式來提供給投資者一些選擇，讓投資者能夠用最快速的時間清楚掌握投資的方向。起初我們這組皆對Mini LED相關產業有興趣，因此我們決定以Mini LED 的概念股做為出發點，接著利用機器學習來預測股價走勢，並加入其他相關公司財務資訊，讓投資者可以在一個網站就得知所有資訊，做出最有利的投資。

LSTM

```
def LSTM_model(dates, prices, test_date, df):
    dataset = df.drop(columns=['date'])
    dataset = dataset.fillna(0)
    dataset = dataset.values

    # normalize the dataset
    scaler = MinMaxScaler(feature_range=(0, 1))
    scaler2 = MinMaxScaler(feature_range=(0, 1))

    data_scaler = scaler.fit_transform(numpy.array(dataset)[:,1:16])
    output_scaler = scaler2.fit_transform(numpy.array(dataset)[:,16].reshape(-1,1))

    dataset = numpy.concatenate((data_scaler, output_scaler), axis=1)

    # split into train and test sets
    train_size = len(dataset) - 2
    train, test = dataset[0:train_size, :], dataset[train_size:len(dataset), :]

    # reshape into X=t and Y=t+1
    look_back = 1
    trainX, trainY = create_dataset(train, look_back)
    testX, testY = create_dataset(test, look_back)
    X_train, X_test, y_train, y_test = train_test_split(trainX, trainY, test_size=0.33, random_state=42)
    # reshape input to be [samples, time steps, features]
    X_train = numpy.reshape(X_train, (X_train.shape[0], 1, X_train.shape[1]))
    X_test = numpy.reshape(X_test, (X_test.shape[0], 1, X_test.shape[1]))
    testX = numpy.reshape(testX, (testX.shape[0], 1, testX.shape[1]))
```

長短期記憶 (Long Short-Term Memory)

深度學習的一種。主要是以短期表現去預測未來長期會發生的事，適合用在股票預測、天氣預測等。

```
def SVR_rbf(dates, prices, test_date, df):
    svr_rbf = SVR(kernel='rbf', C=1e3, gamma=0.1)
    trainX, trainY, testX, testY = create_preprocessed_Dataset(df)
    # trainX = [item for sublist in trainX for item in sublist]
    # testX = [item for sublist in testX for item in sublist]
    X_train, X_test, y_train, y_test = train_test_split(trainX, trainY, test_size=0.33, random_state=42)
    svr_rbf.fit(trainX, trainY)
    decision_boundary = svr_rbf.predict(trainX)
    y_pred = svr_rbf.predict(X_test)
    test_score = mean_squared_error(y_test, y_pred)
    prediction = svr_rbf.predict(testX)[0]

    return (decision_boundary, prediction, test_score)
```

支持向量迴歸 (Support Vector Regression)

支持向量機(SVM)的延伸，不一樣的是SVR可以用來處理回歸的問題。SVR有分為線性與非線性，我們這次是以非線性的高斯轉換來做預測。

Linear Regression

```
def linear_regression(dates, prices, test_date, df):
    lin_reg = LinearRegression()
    trainX, trainY, testX, testY = create_preprocessed_Dataset(df)
    # trainX = [item for sublist in trainX for item in sublist]
    # testX = [item for sublist in testX for item in sublist]
    X_train, X_test, y_train, y_test = train_test_split(trainX, trainY, test_size=0.33, random_state=42)
    lin_reg.fit(trainX, trainY)
    decision_boundary = lin_reg.predict(trainX)
    y_pred = lin_reg.predict(X_test)
    test_score = mean_squared_error(y_test, y_pred)
    prediction = lin_reg.predict(testX)[0]
    prediction = prediction[0]

    return (decision_boundary, prediction, test_score)
```

線性迴歸

依照餵給機器的訓練資料
找出一個最接近各點線性
方程式，並用函式去預測
出新的資料(測試資料)應該
在的位置。

Random Forest

```
def random_forests(dates, prices, test_date, df):
    rand_forst = RandomForestRegressor(n_estimators=10, random_state=0)
    trainX, trainY, testX, testY = create_preprocessed_Dataset(df)
    # trainX = [item for sublist in trainX for item in sublist]
    # testX = [item for sublist in testX for item in sublist]
    X_train, X_test, y_train, y_test = train_test_split(trainX, trainY, test_size=0.33, random_state=42)
    rand_forst.fit(trainX, trainY)
    decision_boundary = rand_forst.predict(trainX)
    y_pred = rand_forst.predict(X_test)
    test_score = mean_squared_error(y_test, y_pred)
    prediction = rand_forst.predict(testX)[0]

    return (decision_boundary, prediction, test_score)
```

隨機森林

屬於整體機器學習演算法(Ensemble learning)，一種由多個決策數組合而成，特徵是效能與預測能力很好，以結合多個弱學習器來建構一個強穩的模型，使模型較不會發生偏差。

```
def KNN(dates, prices, test_date, df):
    knn = KNeighborsRegressor(n_neighbors=3)
    trainX, trainY, testX, testY = create_preprocessed_Dataset(df)
    # trainX = [item for sublist in trainX for item in sublist]
    # testX = [item for sublist in testX for item in sublist]
    X_train, X_test, y_train, y_test = train_test_split(trainX, trainY, test_size=0.33, random_state=42)
    knn.fit(trainX, trainY)
    decision_boundary = knn.predict(trainX)
    y_pred = knn.predict(X_test)
    test_score = mean_squared_error(y_test, y_pred)
    prediction = knn.predict(testX)[0]
    prediction = prediction[0]

    return (decision_boundary, prediction, test_score)
```

K-近鄰演算法 (K-Nearest Neighbor)

輸入一筆資料 i 時，根據與 i 最鄰近的 k 個已知資料類別，去決定該筆輸入資料的類別。這種演算法除了做分類用途，也能用來做近似項目的搜尋。
